## storedValueForKey

```
public java.lang.Object storedValueForKey(java.lang.String key)
```

Returns the value for the property identified by *key*. This method is used when the value is retrieved for storage in an object store (generally, this is ultimately in a database) or for inclusion in a snapshot. The default implementation provided by `EOCustomObject` is similar to the implementation of `valueForKey`, but it resolves *key* with a different method instance variable search order:
